

```
[5]: # Q1. Write and run the small statement - "Hello! My name is ----- and my hobby is -----  
print("Hello! My name is Varun Thakur and my hobby is learning new things")
```

Hello! My name is Varun Thakur and my hobby is learning new things

```
[6]: # Q2 Print the comments  
# In python comments are using hash (#) symbol  
print("Comments")
```

Comments

```
[7]: # Q3 Display integer, float, String, Boolean  
int = 42  
float = 3.14  
string = "Varun Thakur"  
bool = True  
  
print(f"Integer: {int}")  
print(f"Float: {float}")  
print(f"String: {string}")  
print(f"Boolean: {bool}")
```

Integer: 42

Float: 3.14

String: Varun Thakur

Boolean: True

*[1]: # 4. Convert float to integer, String to integer, Boolean to integer

```
# 1. Float to Integer
f = 25.75
x = int(f)
print("Float to Integer:", x)

# 2. String to Integer
s = "150"
y = int(s)
print("String to Integer:", y)

# 3. Boolean to Integer
b = True
z = int(b)
print("Boolean to Integer:", z)
```

Float to Integer: 25
String to Integer: 150
Boolean to Integer: 1

[9]: # Q5 Provide the simple operations performed in the calculator (addition, subtraction, multiplication, division)

```
a = 15
b = 5
print(f"Addition (15 + 5): {a + b}")
print(f"Subtraction (15 - 5): {a - b}")
print(f"Multiplication (15 * 5): {a * b}")
print(f"Division (15 / 5): {a / b}")
```

Addition (15 + 5): 20
Subtraction (15 - 5): 10
Multiplication (15 * 5): 75
Division (15 / 5): 3.0

[10]: #Q6 Write an expression that calculates how many hours there are in 160 minutes

```
hours = 160 / 60
print(f"There are {hours} hours in 160 minutes.")
```

There are 2.6666666666666665 hours in 160 minutes.
